

From workshop setup to participant link

Use SolutionBoss to collect business use cases and recommend a Microsoft solution path without asking participants to know the products first.

Open SolutionBoss on Azure ↗

Portal password: **AISolutioning**

1

Create the workshop

Select **Create workshop link** and set:

- Workshop and customer or team name
- Objective and shared context
- Eligible solution paths
- A separate participant password

2

Check the intake

SolutionBoss generates the Business Use-Case Intake from those settings. Open the participant link in a private window and run the example once before the session.

3

Share the link

Send the participant link and workshop password to attendees. Keep the owner-dashboard link for the Workshop Lead. Participants do not need the main portal password.

What happens after submission

Recommended path

Where to build, why, the MVP to try now and how to start.

Optional · Pilot plan

Readiness, supporting products, build steps and validation.

Owner only · Technical review

Architecture, AIDF trace, risks, alternatives and evidence.

Participants

Describe the business problem and receive one simple recommended starting point. Open the pilot plan only if the group wants to test it.

Workshop Lead / Chief Agent Officer

Use the private owner dashboard to open Technical review, challenge the product and architecture, confirm or revise each path, and export the workshop portfolio.

Keep product choice open during intake. SolutionBoss may recommend conventional automation when a fixed workflow is enough. Verify tenant licensing, connectors, preview status, identity and permissions before build.
